

# StacksWare for Healthcare

## General Summary

StacksWare is application discovery & usage reinvented. Our solution continuously inventories and meters software applications across your healthcare environment, allowing you to make critical decisions in response to end user activities and software usage trends.

As healthcare organizations have adopted virtual desktop infrastructure into their datacenters, StacksWare has been a trusted partner in achieving security and total application visibility into their datacenters and existing physical endpoints.

### Without StacksWare

### With StacksWare

## Security In Your Healthcare Infrastructure

Identify insecure software versions and disallowed software such as Dropbox that pose regulatory compliance violations. We provide a comprehensive audit log to immediately identify when offending applications are launched in the environment. We send proactive real-time notifications to IT stakeholders whenever disallowed software is started or stopped.

Identify all devices and device types that are used to access virtual desktops. You can track BYOD devices that are used to access virtual desktops such as personal Mac, PCs, iPhones, and iPads. These devices may not have been issued by your organization but might still pose regulatory compliance risk.

## Ensure That Applications Are Healthy

Identify when business-critical applications such as on-premise Microsoft Exchange and EHR management servers crash with our agent health notifications systems.

**Replay the exact user events on a virtual desktop or physical workstation that result in EHR application crashes.** You can resolve help desk tickets in minutes rather than hours and prevent end-user frustration.

## Track Usage of Healthcare Software and Devices

Track software usage of expensive EHR systems such as Epic, Cerner, McKesson, and NextGen that are traditionally licensed via concurrent or named user licenses. You can ensure that no single user unnecessarily claims a concurrent user license for long time periods, blocking EHR access from other users.

Determine how different people are accessing their virtual desktops or physical workstations in certain areas of your hospital or medical clinic. **Determine whether certain virtual desktops, thin clients, and physical workstations are underutilized and can be re-appropriated for other purposes.**

Aggregate statistics across different users, physical workstations, and virtual desktop pools with the StacksWare groups feature to understand how different healthcare building areas (e.g. triage, emergency room, intensive care unit, waiting rooms, patient rooms) are utilizing their software.
