

# StacksWare for Security

Today's modern computing environments are complex, serving a variety of applications to diverse user groups.

StacksWare allows administrators to quickly and easily secure all their software application assets via real-time alerts and visibility into what software is provisioned and used throughout the environment.

Applications are often the weakest link in the chain of security inside computing environments, due to their diversity. Commonly, exploits occur from running outdated versions of software that contain known vulnerabilities.

StacksWare provides real-time software monitoring to allow you to reduce your surface area for vulnerability by helping you:

- Ensure only the necessary software is accessible to each person in your org
- Monitor user logon sessions into each machine, device accesses, and more
- Ensure no rogue processes or blacklisted applications are running
- Get daily reports to be aware of abnormal usage patterns
- Ensure no old or compromised software versions are running
- Monitor a group of users, devices, or machines to compare usage patterns and trends
- And much, much, more...

## When it comes to security, reaction speeds are everything.

StacksWare analyzes your data in real-time, and generates immediate alerts, allowing you to react to application-layer issues and vulnerabilities as they arise and reduce your reaction times from days to minutes.

Best of all, StacksWare is uniquely designed to be agentless, meaning installation only takes 15 minutes and requires no managing of software agents. It's that easy to get your entire datacenter secured.

User	Machine	Process Name	Version	Start Time	End Time
cmartin	Windows VM #55	chrome.exe		12/06/2015 02:14 pm	12/06/2015 02:14 pm
